

One of the leading manufacturer in  
Norway of technical rubber products  
for offshore- and onshore industry

RUBBER

STYLE

INNOVATION • DESIGN • TESTING • PRODUCTION - SINCE 1924

# Special design in rubber

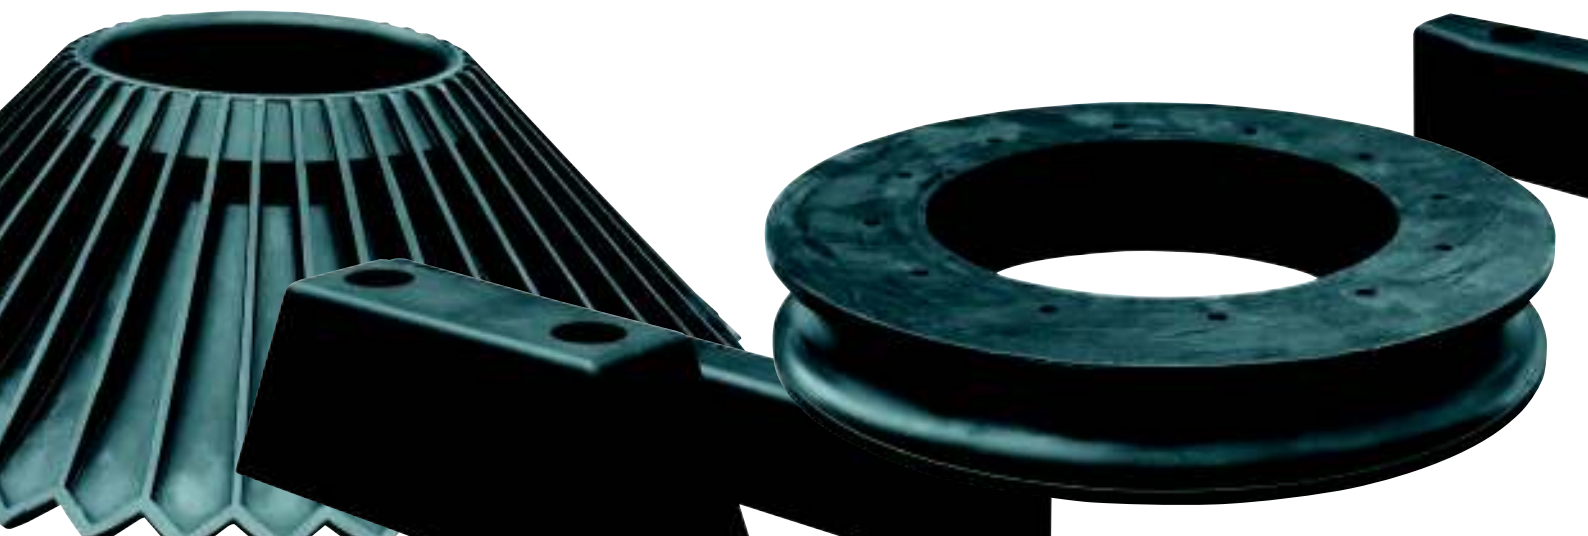

Rubberstyle is our name since 2007, but it all started in 1924 as Stavanger Gummi-industri.

Our company knows the materials and the potentials, and for many years we have been producing technical rubber products for the offshore and onshore industry.

Rubber is a unique raw material. The wear strength and elasticity is well known. By adding other components we are able to do dedicated qualities to the rubber, specific for the task. Acid resistant, oil resistant, fire restraining, frost safe, heat resistant - hard, soft, or whatever needed. We use both synthetic (oil based) rubber and natural rubber.

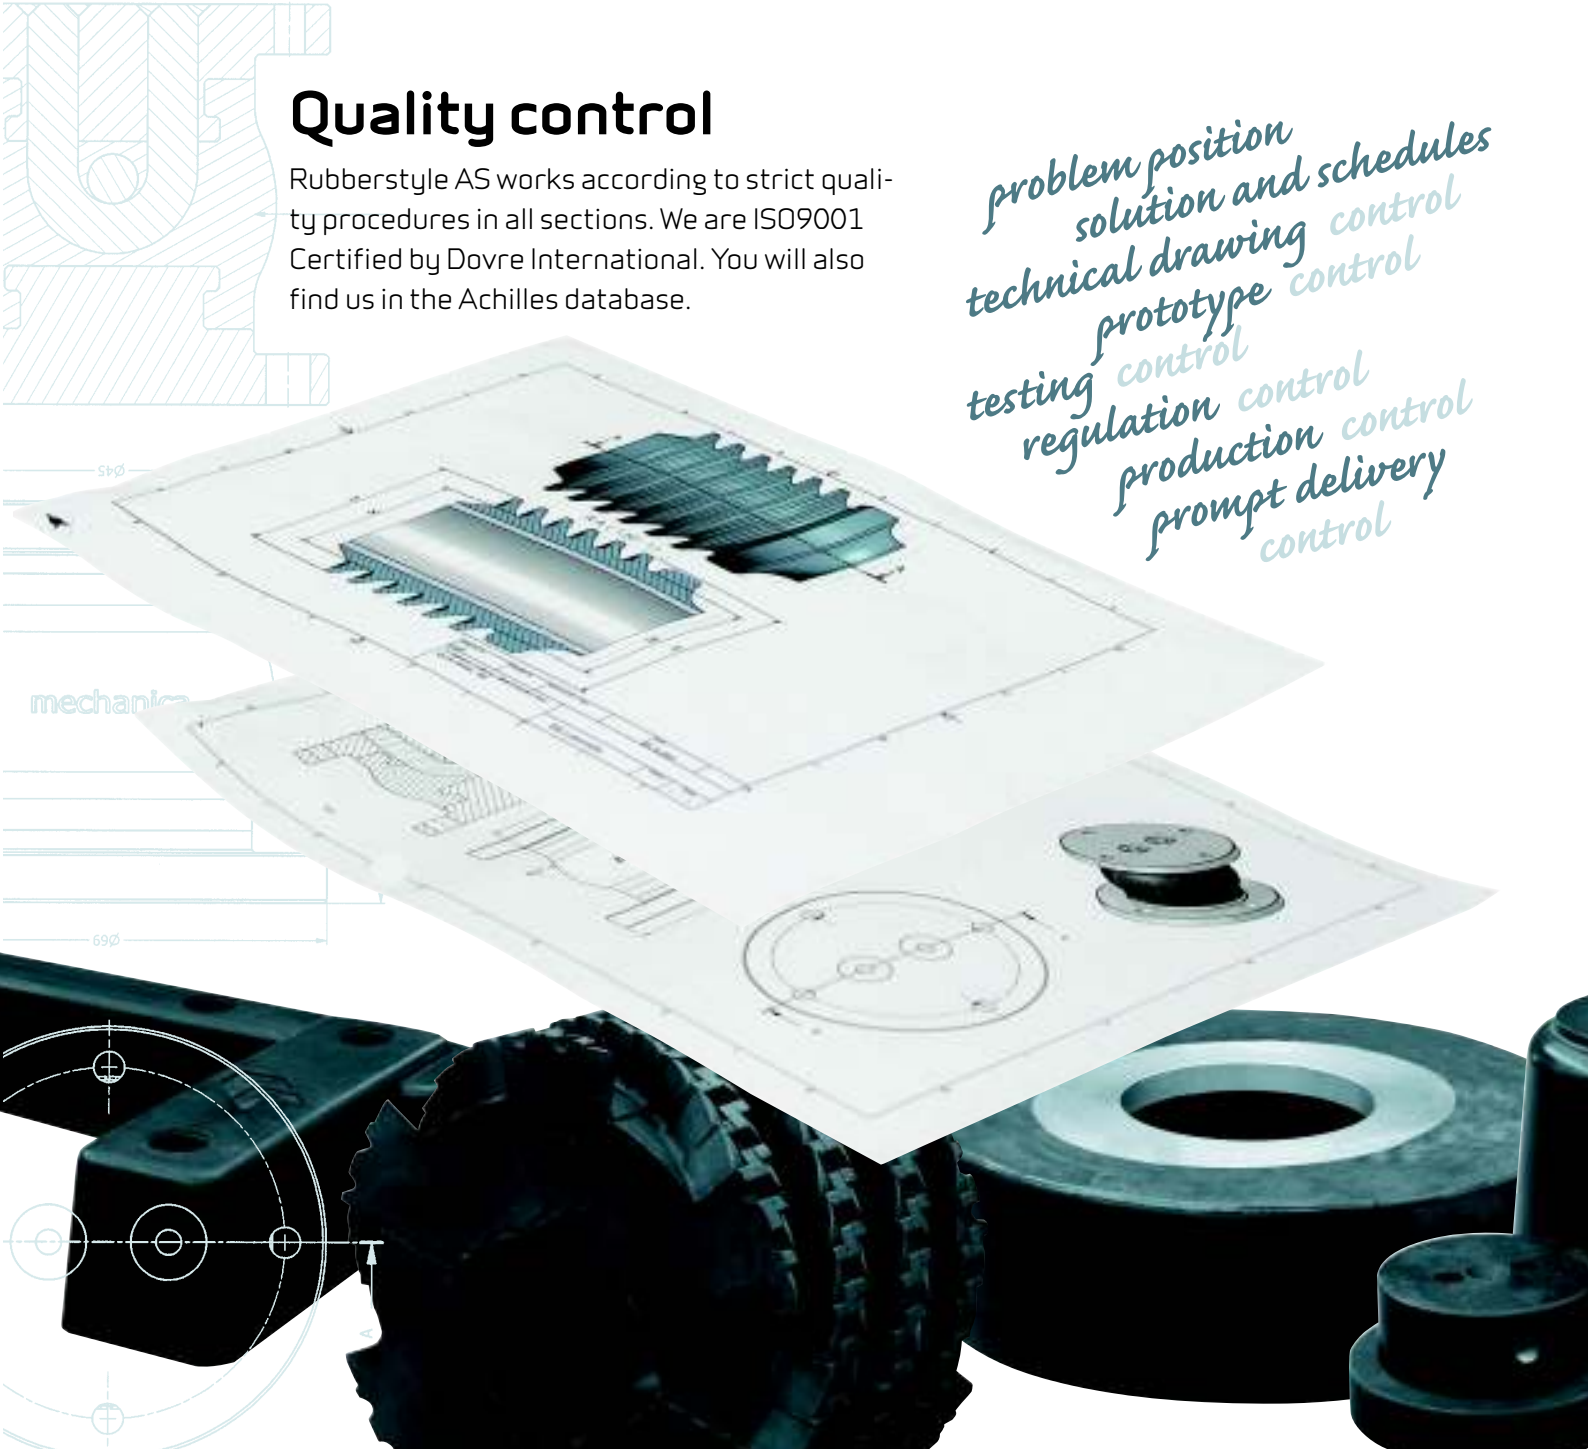

Competent specialists and functional technology give great possibilities regarding the complexity and dimension of the product. By solutions involving rubber, our company is a correct and natural choice.

## Quality control

Rubberstyle AS works according to strict quality procedures in all sections. We are ISO9001 Certified by Dovre International. You will also find us in the Achilles database.

prompt delivery control*

## Give us a challenge

Small or big commission, simple packings or big and complicated mouldings? Our specialists are ready to give you the help and service you need.

A great advantage is to include us early in the process. Rubber is a manifold material which can be supplied with different qualities. We know the materials and the potentiality. Include us already in the development phase. According to experience this will make the very best and most functional solutions.

## HMS policy

In a manufacturing company like ours, danger may easily occur. Big efforts, mechanical machinery, heat and gas will create an environment with great demands to considered procedures and processes. We emphasize on HMS in all our activities. Rubberstyle has a clear 0-damage philosophy. Cuts and rests are treated according to directions and always with a view to the environment.

## Natural rubber and environment

Natural rubber is recovered from the bark of the rubber plants. The rubber plantations create the existence for hundred and thousands of people. Rubber is a unique and renewable raw material, and the demand is always increasing.

Rubber plants are solely best growing in hot and humid climate. In an area about 50 Miles along the equator we find what we call «The Rubber Belt» . From these areas we receive our raw materials. From the trees a milk white liquid is tapped, called Latex. This contains about 67% water and about 33% natural rubber.

By evaporating Latex one obtain natural rubber. This is a simple process not demanding too much energy or technology. The most important is that the industry contribute to maintain important forests in tropical- and subtropical areas.

## Synthetic (oil based) rubber

Synthetic rubber is manufactured in several qualities, all with different qualifications. Some of the secret behind a successful product is to select the correct rubber compound. Our competent experts know and use all kinds of synthetic rubber, every day, all the year – since 1924.
